Scottish Cervical Screening Programme Statistics 2018/19
Annual update to 31 March 2019

3 September 2019

A National Statistics publication for Scotland
This is a National Statistics Publication

National Statistics status means that the official statistics meet the highest standards of trustworthiness, quality and public value. They are identified by the quality mark shown above.

The UK Statistics Authority has designated these statistics as National Statistics signifying compliance with the Code of Practice for Statistics.

Once statistics have been designated as National Statistics, it is a statutory requirement that the Code of Practice shall continue to be observed.

The statistics last underwent a full assessment by the Office for Statistics Regulation (OSR) against the Code of Practice in May 2010. The OSR is the regulatory arm of the UK Statistics Authority.

Find out more about the Code of Practice at:

**Introduction**

Cervical screening was introduced in Scotland in the 1960s. Although large numbers of women were offered tests, the service at this time was not introduced as a population based programme. The national cervical screening programme was introduced in Scotland in 1988 with the aim of reducing the incidence of invasive cancer of the cervix.

Since the introduction of the national screening programme, the incidence of cervical cancer has fallen and in 2017, the latest year available, saw the lowest recorded incidence at 10.1 per 100,000 persons (European age-standardised rate).

Cervical screening is used to identify cell changes which could develop to become malignant, in women who otherwise have no symptoms; at this stage, any changes can be easily treated, and treatment is usually very effective.

From Monday 6th June 2016, the age range of cervical screening changed from ages 20–60 years, to ages 25–64 years. The frequency of cervical screening continued to be every three years from age 25 to age 49, but changed to be every five years for women from age 50 to 64. Women on non-routine screening (where screening results have shown changes that require further investigation/follow up) are now invited up to age 70 years (a change from previous arrangements up to age 68). Women under the age of 25 who had already been invited for a test as part of the screening programme continue to be invited for screening, regardless of whether her recall date was before or after she had reached 25 years and regardless of whether she had attended for screening or not. The publication has been revised to reflect these changes from the September 2017 publication onwards.

Within Scotland (as part of the Scottish Cervical Screening Programme), data for publication and management information are compiled by ISD on a quarterly and annual basis. This publication includes data on uptake by deprivation and Human papilloma virus (HPV) immunisation status, laboratory turnaround times, number of cervical screening tests processed and results. Information on deprivation by age group is being published for the first time. The cervical screening year runs from 1st April to 31st March; this current release includes data to 31st March 2019. The Scottish Cervical Screening Programme Statistics for 2018-19 is a National Statistics publication which has been assessed by the UK Statistics Authority as complying with the Code of Practice.

Eligible women are invited to attend cervical screening once every 3 or 5 years; uptake statistics are therefore based on women attending in the previous 3.5 or 5.5 years. The additional 0.5 year provides a window to allow for the appointment to have taken place after the invitation has been sent.

ISD carried out a consultation during 2017 for users to provide comments on the Scottish Cervical Screening Programme statistics. We have taken those comments into consideration and have provided updated tables by NHS Board of residence and deprivation quintiles.
including 5 year age group information. A summary of the responses we received to the consultation are on the cancer website.
Main Points

- In 2018/19, 407,854 cervical screening tests were processed. Of all tests processed, 97.4% were of satisfactory quality i.e. there were enough cells in the sample.
- The uptake rate for cervical screening was 73.1% with 1,030,703 eligible women having participated in the screening period as at 31st March 2019.
- Uptake of screening is poorest in younger women and increases with age to a peak at 50-54 years.
- Women from the most deprived areas are less likely to take part in the screening programme - two out of three (67%) compared with over three quarters (78%) from the least deprived areas.
- Cervical screening uptake is highest in HPV vaccinated women when compared to the non-vaccinated women. This may be due to immunised women being more aware of risks involved after vaccinations thanks to the education during the immunisation programme.
- Over nine out of 10 tests (91.9%) were negative with no sign of abnormal change in cells with a further 7.1% having low grade cell changes identified leading to recommended enhanced monitoring. 0.9% of women were identified as having a high risk of developing cervical cancer.
Results and Commentary

This publication presents information about the NHS Cervical Screening Programme in Scotland in 2018/19. It includes statistics on women aged 25-64 who are invited for regular screening under the call and recall programme.

From 6th June 2016, changes to the age range and frequency of screening offered by the Scottish Cervical Screening Programme were implemented. Cervical screening is now routinely offered every three years to women aged between 25 and 49 years of age and every five years to women aged between 50 and 64. Women on non-routine screening (where screening results have shown changes that require further investigation/follow-up) will be invited up to age 70 years.

Please note that the following tables and charts are based on the 2014 NHS Board configuration. Figures for NHS Highland now include the Argyll & Bute area and figures for NHS Greater Glasgow now include the Clyde area. The NHS Board is based on the patient’s postcode at the time they had their screening test. Previously published analysis was based on the postcode at the time the data was extracted so comparisons should not be made.

Due to changes in the age and frequency and how the NHS Board has been allocated, uptake statistics are only presented for the latest three years. Further comparable trend data will be available in future publications.

Details of all cervical screening statistics included within this publication can be found on the Cervical Screening homepage.
Uptake of the National Screening Programme

Age-appropriate uptake

Uptake is defined as the percentage of women in a population eligible for screening at a given point in time who were screened adequately within a specified period. As the frequency with which women are invited for screening is dependent on age, as recommended by the UK National Screening Committee, based on differing screening periods for younger and older women. For the total target age group (25 to 64 years), ‘Age-appropriate uptake’ takes into account the frequency with which women of different ages are invited for screening. This defines uptake as the percentage of women in the population eligible for cervical screening who were screened adequately within the previous 3.5 years for women aged 25-49 and 5.5 years for women aged 50-64, as at 31 March 2019.

For women eligible as at 31st March 2019:

- The percentage of eligible women (aged 25 to 64) who were recorded as screened adequately within the specified period was 73.1%. This is up 0.3 percentage points when compared to the previous year.
- Younger women are less likely to participate in the screening programme. Uptake of cervical screening is lowest in women aged 25-29 years old (61.8%) and increases with age to a peak of 80.5% at age 50-54 years after which the uptake declines again towards 72.5%.

**Figure 1: Uptake of cervical screening for women aged 25-64\(^1\) by age group, Scotland: 2018/19**

![Uptake of cervical screening for women aged 25-64 by age group, Scotland: 2018/19](image)

Source: Scottish Cervical Call Recall System

Notes:

1. Based on the Scottish Cervical Call Recall System (SCCRS) population denominator (excluding medically ineligible women).
Cervical Screening Update for women aged 25-49

For those aged 25-49, uptake is calculated as the percentage of women eligible for screening who have had an adequate screening test within the last 3.5 years on 31 March 2019. These data show:

- Nationally, 7 out of ten women aged 25-49 took part in the screening programme (70.8%).
- However, the level of uptake between NHS boards ranges between 66.5% and 79.5%. The two largest NHS boards, NHS Greater Glasgow & Clyde and NHS Lothian have noticeably lower uptake rates in this age group than the other NHS boards.

Figure 2: Cervical screening uptake, women aged 25 - 49\(^1\), by NHS Board of residence: 2018/19

Source: Scottish Cervical Call Recall System

Notes:

1. Based on the Scottish Cervical Call Recall System (SCCRS) population denominator (excluding medically ineligible women).
Cervical Screening Update for women aged 50 - 64

For those aged 50-64, uptake is calculated as the percentage of women eligible for screening who have had an adequate screening test within the last 5.5 years on 31 March 2019. For these data:

- There is greater participation in the screening programme by women aged 50-64 than in the younger group. More than 3 out of 4 women (76.9%) took part in the screening programme.

- There is also less variation between NHS boards compared with the younger age group with the uptake rates ranging from 75.2% to 79.2%

- The level of uptake has remained broadly similar over the last three years in each NHS Board.

Figure 3: Cervical screening uptake, women aged 50-64\(^1\), by NHS Board of residence: 2016/17 - 2018/19

Source: Scottish Cervical Call Recall System

Notes:

1. Based on the Scottish Cervical Call Recall System (SCCRS) population denominator (excluding medically ineligible women).
Cervical Screening Uptake by Deprivation

- Women from deprived areas are less likely to participate in the screening programme. For the most deprived areas, 67.2% of eligible women were screened compared with 78.0% of women from the least deprived areas – a difference of more than 10 percentage points (Table 1 and Figure 4).
- The difference in uptake rates by deprivation area is more marked in women aged 50-64. There is a 15 percentage point difference between the least and most deprived areas compared with a difference of eight percentage points in women aged 25-49.

Cervical Screening Uptake by HPV vaccination status

Human papilloma virus (HPV) is a DNA virus that infects the deepest layer of the skin or genital surfaces (epithelium). Over 100 different types are recognised, some of which are known to be related to the development of cancer. The most common HPV-induced cancer is cervical cancer, with HPV 16 and 18 responsible for 70% of cervical cancers worldwide. The remaining 30% of cervical cancers are caused by the other 16 high-risk HPV types.

Most significant changes in the cells of the cervix are caused by HPV passed on through intimate contact. HPV is very common, 8 out of 10 people in Scotland will contract it at some point in their lives. As there are usually no symptoms, many people live with HPV for months or even years without knowing they have it.

Scotland has a highly organised and effective school-based immunisation programme. Uptake of vaccine in the catch-up cohorts (the catch-up programme ran from September 2008 to end of 2011 and targeted girls from their 13th birthday until their 18th birthday) was 65% overall, varying between 40% in school leavers and 80% in those still at school. Routine immunisation of girls aged 11-12, has an uptake of 90% or greater. The Immunisation Status of 'Full' indicates the course of immunisations has been completed; 'Incomplete' indicates that one or more doses of vaccine have been administered but the course has not been fully completed, and 'Non-Immunised' means that no vaccine has been given.

Girls immunised as part of catch-up entered the screening programme at age 20 in 2010; those immunised routinely entered the programme in 2015. Following the change in age range in June 2016, no further routinely immunised women will start screening until 2021. Continued attendance for cervical screening after immunisation is important for many reasons. The HPV types covered by the vaccines currently account for between 75 and 90% of cancers in Scotland, depending upon the vaccine given. However, this leaves between 10 and 25% of tumours for which regular screening is still the only prevention.

- Women aged 22-27 who have been immunised against HPV are nearly twice as likely to participate in the screening programme compared with women who have not been immunised against HPV (69.4% vs 36.4%).

- This may be partly due to the education provided as part of the HPV immunisation programme, making women more aware of cervical cancer and its associated risks. Other factors, such as socio-economic deprivation, will also influence both immunisation and screening behaviour.

Figure 5: Percentage uptake of females aged 22-27\(^2\) by HPV Immunisation Status\(^1\), Scotland: 2018/19

1. The Immunisation Status of Full is where the individual has been Fully Immunised, i.e. had all HPV doses. Incomplete is where the individual has had at least one of the Immunisations but not all of them.
2. Based on SCCRS population denominator (excluding medically ineligible women) ages 22-27.
3. Numbers vaccinated in some NHS boards have very small numbers of incomplete vaccinations; this will affect the uptake percentage.
4. The ages reported will expand once more time has passed to allow females who have been immunised for HPV to be eligible for screening.
Workload statistics

Trends in cervical screening processing

- In 2018/19, there were 407,854 cervical screening tests processed within the programme and this is line with trend over the last 10 years (Figure 6).

- The number of tests processed in the last 10 years has varied between around 378,400 and 417,300.

Figure 6: Number of cervical screening tests processed\(^1\) at NHS laboratories, Scotland: 2009/10 to 2018/19

1. Data include unsatisfactory screening tests.
• The highest number of screening tests processed in 2018/19 was in Q4 when 117,982 tests were processed.

Figure 7: Trends in the number of cervical screening tests processed\(^1\) by quarter, Scotland: quarterly from 1 April 2014 to 31 March 2019

1. Data include unsatisfactory screening tests.
Laboratory turnaround times

It was agreed by members of the Scottish Cervical Screening Programme Quality Assurance Reference Committee (QARC) that turnaround times for 95% of all screening tests processed in Scotland provides a more informative reflection of the time taken to turnaround samples than the mean figure. This change in reporting has been implemented from the 2013 publication. Previously published mean turnaround figures are available here.

- In 2018/19 the laboratory turnaround time for 95% of all cervical screening tests processed in Scotland ranged from 26 days in Q2 to 37 days in Q4 (Figure 8). The figures for 2018/19 show an increase in turnaround times in all quarters when compared to 2017/18.

- The laboratory turnaround time of 37 days in Q4 for 2018/19, for processing 95% of cervical screening tests is the highest in the previous five years. This is likely due to the increased number of screening tests submitted for analysis in Q4 while many laboratories are experiencing recruitment and retention difficulties due to the forthcoming change to the primary screening test.

Figure 8: Turnaround times\(^1\) (days) for 95% of all cervical screening tests processed by quarter: Scotland, 1 April 2014 to 31 March 2019

---

\(^1\) The turnaround time is defined as the number of days from the date the sample was received by the laboratory to the date the report was issued by the laboratory.
Cervical screening results

In 2012/13 changes were made to screening test result categories in accordance with those agreed by the British Association for Cytopathology. These have been incorporated in all tables and charts. Please see glossary for more information.

- The percentage of screening test results indicating high grade cell changes, which require a further examination, has remained low at around 0.9-1.4% over the last ten years, a low of 0.9% in 2018-19 (Table 3).

¹ Please refer to the glossary on page 18 to see how low and high grade cell change are categorised.
**Unsatisfactory screening results**

- In 2018/19 the percentage of unsatisfactory screening tests, where insufficient cells have been taken for testing, decreased by 0.2 percentage points to 2.6% when compared to 2017/18.

- The percentage of unsatisfactory screening tests has varied over the past 10 years (ranging from 2.4% to 3.0%).

*Figure 10: Percentage of unsatisfactory screening results, Scotland: 2009/10 to 2018/19*
Invasive cervical cancer incidence

- Over the last 35 years, European age-standardised rates have fallen from 18.6 diagnoses of cervical cancer per 100,000 persons in 1981, to 10.1 in 2017 (Figure 9). This may be partly due to the continued efforts of the cervical screening programme.
- Specifically, there has been a decrease in incidence rate from (2014 figure) to 10.1 per 100,000 persons, the lowest recorded incidence of cervical cancer.
- There is, as yet, no clear indication of a change in invasive cervical cancer incidence among women aged 20-24 as a result of HPV vaccination [http://www.isdscotland.org/Health-Topics/Cancer/Cervical-Screening/](http://www.isdscotland.org/Health-Topics/Cancer/Cervical-Screening/)

Figure 9: Cervical Cancer Incidence (European Age Standardised Rates) Females of All Ages, Scotland: 1981-2017

Appendices

Appendix 1 – Background information

The use of cervical screening to detect changes in cells, which could develop to become malignant, has been shown to reduce cervical cancer incidence and mortality. The test involves analysing cells which have been taken from the neck area of the womb, also known as the cervix. Routine checks ensure that any changes in cells can be picked up, monitored and treated if necessary.

From Monday 6th June 2016, the age range for cervical screening changed from ages 20–60 years, to ages 25–64 years plus 364 days. The frequency of cervical screening continued to be every three years from age 25 to age 49, but changed to be every five years for women from age 50 to 64 plus 364 days of age. Women on non-routine screening (where screening results have shown changes that require further investigation/follow up) are now invited up to age 70 years plus 364 days of age (a change from previous arrangements up to age 68). Women under the age of 25 who had already been invited for a test as part of the screening programme continue to be invited for screening, regardless of whether her recall date was before or after she had reached 25 years and regardless of whether she had attended for screening or not.

Until May 2007, Cervical Cytology Statistics were collected quarterly from laboratories on form ISD(D)1Q and annually from health boards on form ISD(D)4, with data being compiled by ISD Scotland. More information can be found on our data sources page.

In May 2007, following a review of local call recall arrangements in Scotland, a new national IT system, the Scottish Cervical Call Recall System (SCCRS), was introduced across NHS Scotland. Cervical screening data are currently collected by each of the laboratories in Scotland and retained on the Scottish Cervical Call Recall System (SCCRS). SCCR collects information relating to each step as a woman moves through her screening episode. More information on SCCR can be found on the National Services Division website at www.nsd.scot.nhs.uk.

For publication and management turnaround, ISD extracts data from SCCR on cervical screening tests carried out in Scotland on a quarterly basis, for periods ending 31st March, 30th June, 30th September and 31st December. In addition to this, ISD also extract information on cervical screening uptake figures on an annual basis, for years ending 31st March. Until 31st March 2008, uptake rates for those women invited to attend cervical screening in the previous 3.5 years had declined year on year across Scotland. The majority of the decrease, almost 7%, occurred between 31st March 2007 and 31st March 2008. This decline coincided with the implementation of a new standardised recording system, which has improved the quality of the data collected and could explain some of the decrease.

For the 2013 publication onwards, it was agreed by members of the Scottish Cervical Screening Programme Quality Assurance Reference Committee (QARC) that turnaround
times for 95% of all screening tests processed in Scotland provide a more informative reflection of the time taken to turnaround samples than the mean figure (as published prior to 2013).

All analytical support of the Scottish Cervical Screening Programme is provided by ISD Scotland.

<tr>
<th>Revisions statement</th>
<th>A national IT system, the Scottish Cervical Call Recall System (SCCRS), was introduced across Scotland in May 2007 to standardise the recording of cervical screening information. The SCCR System has improved the quality of the data collected. Data included in this publication prior to May 2007 is compiled from legacy applications.</th>

<tr>
<td>Relevance and key uses of the statistics</td>
<td>ISD's Scottish Cervical Screening Programme statistics are designed for monitoring and evaluating the effectiveness of the Scottish Cervical Screening Programme. The statistics are used for a variety of purposes, including: • informing Scottish Government planning, including NHS spending and the development of the Scottish cancer care action plan; • informing NHS Boards' planning and commissioning of cancer services; • health services research and clinical audit; • promoting changes in societal behaviour, such as increasing screening uptake rates; and • providing information to compare with UK and international health data.</td>
</tr>
<tr>
<td>Accuracy</td>
<td>All cervical screening data are subject to validation when entered onto SCCR System. Further checks on figures are carried out by individual laboratories on a quarterly basis. Any inaccuracies are then reported back for investigation and correction, if necessary.</td>
</tr>
<tr>
<td>Completeness</td>
<td>At time of extraction, data for the most recent year are estimated to be</td>

</tbody>
</table>
### Comparability
Currently, cervical screening statistics are not generally compared with other areas of the UK. The eligible age range for invitation to cervical screening varies within the UK.

### Coherence and clarity
All cervical screening tables are accessible via the [Cervical Screening homepage](#).

Cervical screening data are presented within Excel spreadsheets for each table.

### Value type and unit of measurement
Number of cervical screening tests, results of tests and average turnaround times are reported as a count; uptake and % results are reported as a percentage.

### Disclosure
The [ISD protocol on Statistical Disclosure Protocol](#) is followed.

### Official Statistics designation
National Statistics

### UK Statistics Authority Assessment
Assessment by UK Statistics Authority for National Statistics designation completed.

### Last published
4 September 2018

### Next published
1 September 2020

### Date of first publication
3.5 & 5.5 year uptake information by NHS Board of Residence is available from 1st January 1995.

Annual workload information, for the number of cervical screening tests processed, is available from 1st January 1995.

Appendix 3 – Early access details

Pre-Release Access
Under terms of the "Pre-Release Access to Official Statistics (Scotland) Order 2008", ISD is obliged to publish information on those receiving Pre-Release Access ("Pre-Release Access" refers to statistics in their final form prior to publication). The standard maximum Pre-Release Access is five working days. Shown below are details of those receiving standard Pre-Release Access.

Standard Pre-Release Access:
Scottish Government Health Department
NHS Board Chief Executives
NHS Board Communication leads

Early Access for Quality Assurance
These statistics will also have been made available to those who needed access to help quality assure the publication:
Scottish Cervical Screening Programme National Coordinator and Programme Manager – National Service Division
NHS Board Cervical Screening Laboratory contacts
Cervical screening Quality Assurance Reference Committee (QARC)
Appendix 4 – ISD and Official Statistics

About ISD
Scotland has some of the best health service data in the world combining high quality, consistency, national coverage and the ability to link data to allow patient based analysis and follow up.

Information Services Division (ISD) is a business operating unit of NHS National Services Scotland and has been in existence for over 40 years. We are an essential support service to NHSScotland and the Scottish Government and others, responsive to the needs of NHSScotland as the delivery of health and social care evolves.

**Purpose:** To deliver effective national and specialist intelligence services to improve the health and wellbeing of people in Scotland.

**Mission:** Better Information, Better Decisions, Better Health

**Vision:** To be a valued partner in improving health and wellbeing in Scotland by providing a world class intelligence service.

Official Statistics
Information Services Division (ISD) is the principal and authoritative source of statistics on health and care services in Scotland. ISD is designated by legislation as a producer of ‘Official Statistics’. Our official statistics publications are produced to a high professional standard and comply with the Code of Practice for Official Statistics. The Code of Practice is produced and monitored by the UK Statistics Authority which is independent of Government. Under the Code of Practice, the format, content and timing of statistics publications are the responsibility of professional staff working within ISD.

ISD’s statistical publications are currently classified as one of the following:

- National Statistics (ie assessed by the UK Statistics Authority as complying with the Code of Practice)
- National Statistics (ie legacy, still to be assessed by the UK Statistics Authority)
- Official Statistics (ie still to be assessed by the UK Statistics Authority)
- other (not Official Statistics)

Further information on ISD’s statistics, including compliance with the Code of Practice for Official Statistics, and on the UK Statistics Authority, is available on the [ISD website.](#)
