Childhood Immunisation Statistics Scotland
Quarter ending 30 June 2018
A National Statistics publication for Scotland

Publication date: 25 September 2018

About this release
This release by Information Services Division provides a quarterly update of immunisation uptake rates for children in Scotland at 12 months, 24 months, five years and six years of age, by NHS Board and local authority.

Vaccination programmes for children in Scotland aim both to protect the individual child from many serious infectious diseases and to prevent the spread of disease within the wider population.

Main Points
- Uptake rates by 12 months of age increased slightly and remain above 95% for complete primary courses of immunisation of Pneumococcal Conjugate Vaccine (PCV), MenB vaccine, and the five-in-one vaccine, which protects against; diphtheria, tetanus, pertussis (whooping cough), polio and Haemophilus (Hib).
- Uptake of the complete two dose course of rotavirus vaccine by 12 months of age remained at 93.5%.

Primary immunisation uptake rates by 12 months of age, by quarter

Source: SIF5
• Uptake rates of the Hib/MenC and PCV booster vaccines by 24 months both increased slightly, with rates at 95.1% and 95.3% respectively.
• The national target is for 95% uptake of one dose of the MMR vaccine by five years of age, with a supplementary measure at 24 months. Uptake of one dose of MMR vaccine increased slightly to 94.5% by 24 months of age and 96.9% by five years of age. Uptake rates of one dose of MMR by five years have remained above the 95% target since 2009.

Background
As a public health measure, immunisations are very effective in reducing the burden of disease. The European Region of the World Health Organization (WHO) recommends that on a national basis at least 95% of children are immunised against diseases preventable by immunisation and targeted for elimination or control. These include diphtheria, tetanus, pertussis, polio, Haemophilus influenzae type b (Hib), measles, mumps and rubella. In Scotland a target of 95% uptake of one dose of the Measles, Mumps and Rubella (MMR) vaccine by five years of age (with a supplementary measure at 24 months) was introduced in 2006 to focus efforts on reducing the number of susceptible children entering primary school.

Further Information
The data from this publication is available to download from our web page. We also make available background metadata and information on our pre-release access.

Our annual report on childhood immunisation uptake rates in Scotland was published in March. This report provides comprehensive commentary on immunisation including an outline of the UK childhood immunisation schedule, statistics by calendar year and an explanation of trends in uptake rates.

For more information on Immunisations see the Immunisation section of our website. For related topics, please see the Child Health pages.

The next release of this publication will be in December 2018.
