About this release

This publication from the Information Services Division provides information on the percentage of time spent at home or in a community setting in the last six months of life. Please note that hospital data for the latter part of 2016/17 is not yet complete and so figures shown for this financial year are considered provisional. This should be taken into account when interpreting the results.

Main points

- There were 53,870 deaths in Scotland during 2016/17, excluding those where an external cause such as unintentional injury was recorded.
- Of these people, 87% of their last six months of life was spent at home or in a community setting with the remaining 13% of time spent in hospital. This has remained broadly similar over the seven years from 2010/11 to 2016/17.

Percentage of last six months of life spent at home or in a community setting; financial years 2010/11 - 2016/17

1. Figures from 2015/16 and 2016/17 are provisional.
• The percentage of those in the youngest age group that spent their last 6 months at home or in the community was slightly higher than the percentage in the oldest age group; 92% in the 0-54 age group compared to 87% for those aged 85+. This may reflect the different causes of death in these age groups.

• The percentage of the last six months of life spent at home or in a community setting for those living in the most deprived areas is the same as those living in the least deprived areas.

Background

This Quality Outcome Measure focuses on measuring the impact of the Scottish Government’s ‘Living and Dying Well’ and in particular on its objective to “produce achievable and measurable changes which will ensure quality improvement and enhance patient and carer experience”.

The percentage of time spent at home or in a community setting towards the end of life provides a high level indication of progress in implementation of the national action plan. This is inferred by measuring the amount of time spent in a hospital setting during the last months of life (using hospital admissions data) and from this estimating the time spent at home or in a community setting.

Please note that, in addition to incomplete hospital data, National Records of Scotland death data for 2016 and 2017 are provisional and may be revised slightly in the future.
